Reducing medicines waste throughout the patient journey
Simple guide and supporting information

Not using medicines as intended is a waste of scant NHS resources. Medicines are also key to the sustainability agenda with pharmaceuticals accounting for 22% of the NHS carbon footprint.

The NHS is facing financial challenges, which are estimated in the Five Year Forward View to be around £30bn in 2020/21. Medicines are known to be the most common therapeutic intervention in healthcare, but their use is often suboptimal for a variety of reasons and this can lead to medicines not being used as intended and ‘waste’ in the health economy.

Medicines Optimisation, with its patient-focused approach, tries to ensure that the right patient gets the right choice of medicine, at the right time. With this focus on the patient and their experiences, decisions can be made that help the patient to improve their outcomes and take their medicines correctly. This will then lead to the avoidance of taking unnecessary medicines, medicines wastage will be reduced and medicines safety will be improved. All of which will reduce the amount of money that could be ‘wasted’.

There are plenty of opportunities throughout the patient journey to make interventions that can help reduce medicines waste. This resource aims to highlight some of the key interventions that can be made and links to current good practice. To put this into clinical context a patient journey has been used to illustrate where waste can be minimised.

---

Case Study Background Information

Mrs B is 78, lives alone in her own home and her FP10 repeat medicines are listed below.

Ramipril 2.5mg bd x112
Aspirin 75mg od x28
Bisoprolol 5mg od x56
Omeprazole 20mg od x 28
Atorvastatin 10mg od x 28
Paracetamol 500mg 1-2 prn x100

OTC/herbals: Multivitamins with added vitamins A and D
Allergy: Trimethoprim – Skin rash

In this guide the case of Mrs B is used to illustrate how medicines issued to her but not used as intended could be reduced or avoided as she moves between care settings. Many aspects of this are dependent on her clinical condition so information on her care plan is also included. However, the clinical details are used for illustrative purposes only.
## Primary care - Medicine quantities

## Primary care - Adherence

<table>
<thead>
<tr>
<th>What happened?</th>
<th>Clinical issues and care plan</th>
<th>Solutions + Who can fix</th>
<th>Information</th>
</tr>
</thead>
</table>
| Mrs B stopped taking the bisoprolol because she thought it was making her dizzy and she didn’t want to take so many medicines. She didn’t like to tell the GP or pharmacist because they were busy | Mrs B had a myocardial infarction 3 years ago. She knows she has a lot of medicines for her heart. The bisoprolol could be causing dizziness but the ‘pill load’ may be more important for her. Beta blockers protect the heart post MI, reducing morbidity and mortality, so non-adherence needs to be addressed | Shared decision making  
*Patient, Prescribers, Pharmacists, Nurses Other Health Professionals*

MUR service (Target group) [Link] |
| Mrs B often omitted the night time dose of ramipril. It was inconvenient and she didn’t think it would do much good while she was asleep | Ramipril can be taken once a day so it may well be possible to change the regimen to once rather than twice daily. The dose is quite low for cardiovascular prophylaxis so a dose increase might also be considered | | NPC - Guide to Medication Review 2008 [Link]
