Re: Mo99 supply returning to normal

Dear valued customer,

Curium would like to inform you that both the Maria reactor and HFR reactor have restarted which means that our Mo99 will gradually return to normal. Due to shorter than normal irradiation in the beginning we will have a ramping up of available activity.

This will mean for you that we will restart UTK and Sodium Pertechnetate (99mTc) Generator Cis bio generators' shipments end of this week.

However, these generators will have a reduced Mo99 content.

Please also note that we currently expect that beginning of next week we should be back to normal.

The exact impact will be communicated by your local customer service teams as soon as we have more data.

We apologize for the inconvenience this shortage has caused for you and your patients and would like to thank you for your patience during this very difficult period.

Sincerely,

Mart-Jan Blauwhoff
Scientific Marketing director SPECT Europe
